## ECE 101 Exploring Electrical Eng.

- MATLAB
- Arithmetic Operators
- Elementary Math Functions
P.K. Wong and B. Pejcinovic

## Arithmetic Operators (Scalar)

| Operation | Operator | Key |
| :--- | :---: | :--- |
| addition | + | plus |
| subtraction | - | minus |
| \& negation |  |  |
| multiplication | * | asterisk |
| right division | / | slash |
| power | ^ | caret |
| grouping | ( ) | parentheses |

Operator Precedence:

| Operation | Association | Precedence |
| :--- | :---: | :---: |
| parentheses | highest |  |
| raise to a power |  |  |
| multiplication, division | Left to Right |  |
| addition, subtraction | Left to Right | lowest |

- Precedence $\rightarrow$ specifies which operator is evaluated first when operators of different precedence are adjacent
- Association $\rightarrow$ specifies which operator is evaluated first when operators of the same precedence are adjacent

Try these examples (using MATLAB as calculator):
a) $3+4 \rightarrow 7$
b) $-1+3 \rightarrow 2$
c) $17.52 * 3.14 \rightarrow 55.0128$
d) $3^{\wedge} 1.5 \rightarrow 5.1962$
e) $3^{\wedge}(3 / 2) \rightarrow 5.1962$
f) $3 \wedge 3 / 2 \rightarrow 13.5$
g) $2 *(4+6) \rightarrow 20$
h) $2 * 4+6 \rightarrow 14$
j) $2-2 * 2 \wedge 2 * 2-2 \rightarrow-16$

## Elementary Math Functions

| Function | Desaription |  |
| :--- | :--- | :--- |
| $\operatorname{abs} \mathbf{( x )}$ | Absolute value | $\|x\|$ |
| $\exp \mathbf{( x )}$ | Exponential | $e^{x}$ |
| factorial (x) | Factorial function | $x!$ |
| $\log \mathbf{( x )}$ | Natural logarithm | $\log _{e}(x) \equiv \ln (x)$ |
| $\operatorname{log10(x)}$ | Base 10 logarithm | $\log _{10}(x)$ |
| $\operatorname{sqrt} \mathbf{( x )}$ | Square root | $\sqrt{x}$ |

Note: classic mistake is to exchange or confuse $\log (\mathrm{x})$ and $\log 10(\mathrm{x})$ !

| Function | Description (xin degrees) | Inverse Function |
| :--- | :--- | :--- |
| sind (x) | Sine of $x$ | asind (x) |
| $\operatorname{cosd} \mathbf{( x )}$ | Cosine of $x$ | $\operatorname{acosd}(\mathbf{x})$ |
| tand (x) | Tangent of $x$ | atand (x) <br> $\operatorname{secd}(\mathbf{x})$ |
| Secant of $x$ | asecd (x) |  |

MATLAB also supports radians versions of these trig functions, e.g. in $\operatorname{sind}(x) x$ is in degrees, but in $\sin (\mathrm{y}) \mathrm{y}$ is in radians.

## Example:

$\begin{array}{ll}\sin (\mathrm{pi} / 2) \rightarrow 1 & \text { sind }(90) \rightarrow 1 \\ \operatorname{asin}(1) \rightarrow 1.5708 & \text { asind(1) } \rightarrow 90\end{array}$

Examples to try:
a) $\left.\frac{3^{2}+(-4)^{2}}{\ln (2)} \rightarrow 3^{\wedge} 2+(-4)^{\wedge} 2\right) / \log (2)$
b) $\frac{\cos \left(\frac{\pi}{3}\right)}{1-5^{1 / 3}} \rightarrow \cos (\mathrm{pi} / 3) /\left(1-5^{\wedge}(1 / 3)\right)$
c) $\sqrt{2} e^{-(0.2)^{2}} \quad \rightarrow \operatorname{sqrt}(2) * \exp \left(-0.2^{\wedge} 2\right)$
d) $\log (|-5.2|) \rightarrow \log 10(\mathrm{abs}(-5.2))$
